Windows 7 CRACK

https://cracklab.team/PAunlock/

https://github.com/Blaukovitch/Mozilla_Firefox_Windows_7

*27/02/2026, Head office of **386 Team WorkGroup**, re-engineer ELF*

What is this?

This is a binary hack of the officially distributed Google Chrome Enterprise (EN). This project is initial Google Chrome Windows 7 crack project during version 114, from which the key based principles of hacking the application were borrowed.

To a greater extent, the goal of this project is to show:

1) how insignificant the differences between Windows 7 and Windows 10 are, in order to undermine Microsoft;

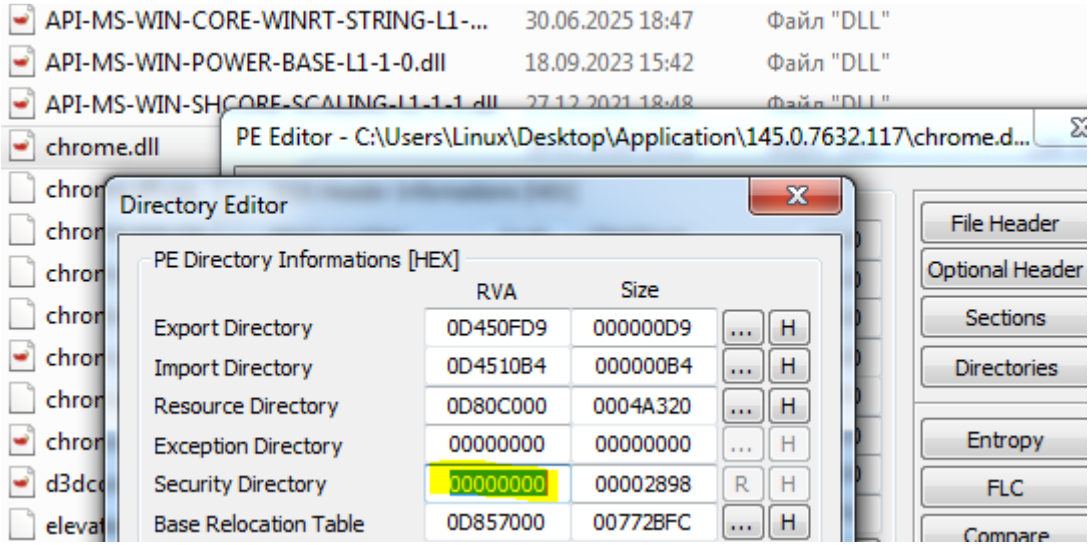
2) how lazy and bad software corporations are, refusing in the most absurd way to support Windows 7 / Windows Server 2012, even though there are simply no technical obstacles to doing so;

The authors of this hack rightly consider Windows 7 to be one of the best operating systems ever released by Microsoft. You can see for yourself. Even many years after the official end of support, it is possible to run the latest version of Google Chrome.

Be advice! Google and Microsoft have already blocked these GitHub repositories in accordance with DMCA enforcements.

Security (anti-virus) warnings:

Most PE COFF files in the folder have had their digital signatures removed. Since binary changes have been made, the checksum of such a file is naturally violated and the signature becomes invalid. Since antivirus software may consider such a file to be infected in this case, the contents of the field in the security section of the PE file are reset to zero (as shown in the example of the dynamic library chrome.dll, which is opened in the PeTools hacker utility):



If you have any antivirus issues, please report them as a regular technical issue on GitHub or contact me by any available means.

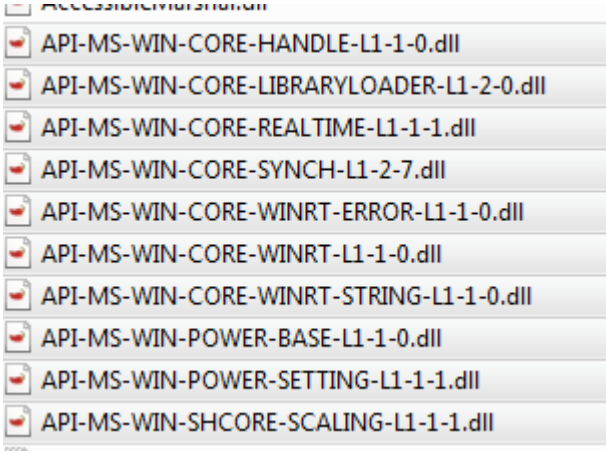
How this work?



For the most part, the issue lies in the missing WinAPI functions for the Windows 7 operating system. Similar technical problems are already being solved by projects such as VxKex (VxNext). In the case of our project, we use standard dynamic libraries—wrappers[1] over Windows system libraries that emulate the missing WinAPI. Fortunately, this is a fairly simple process, and there are no more than 20 missing WinAPI functions. Naturally, it was necessary to edit the PE COFF file import table for correct calling in the Windows 7 environment.

The first program use for hacking is Dependency Walker (https://dependencywalker.com/). Determines which WinAPIs will be emulated during the crack process.

A binary code change has also been made, mostly affecting UNICODE strings in “bcryptprimitives.dll” (a Windows system library used to generate random numbers when creating cryptographic algorithms), various GUIDs located in the .rdata section of PE COFF files, and the

[1] **API-MS-WIN_XP open source project** https://github.com/Blaukovitch/API-MS-WIN_XP

disabling of certain functions related to the creation of COM objects (WinAPI CoCreateInstance), which is necessary to eliminate the crashes found.

For example, we used x64dbg (x32dbg) for binary patch:

```
chrome.exe - PID: 3800 - Module: chrome_elf.dll - Thread: 4012 - x32dbg

xcryptprimitives

More technical Chrome Windows 7 CRACK information is available.

How to start?

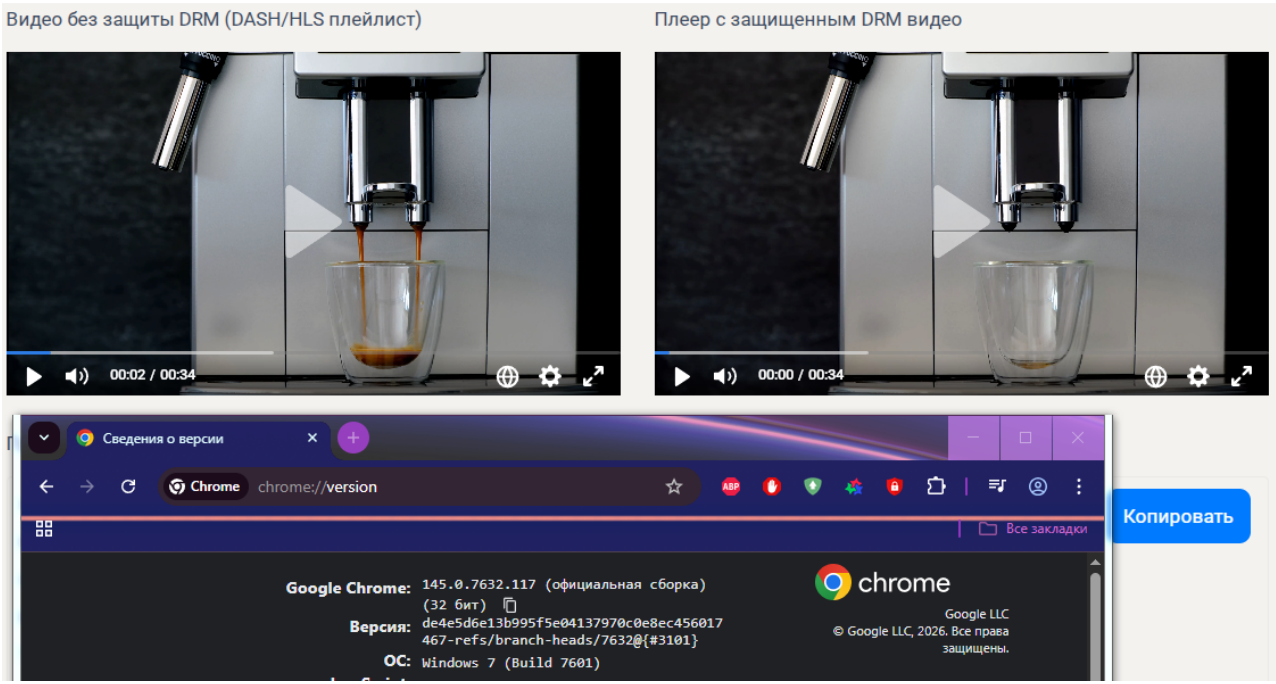
1) Recommended BACKUP you current Google Chrome profiles in folder "%APPDATA%\..\Local\Google\Chrome\User Data"

> To quickly navigate to the Profiles folder, you can use a batch script file !!!CHROME_Profiles.bat

2) You can use any method convenient for you:
   a. to replace the existing version of Chrome in the folder C:\Program Files\Google\Chrome\Application
   b. or simply copy it to any other separate folder. In this case, the only difference will be which of the two browsers you want to set as the default to launch;
3) Launch Chrome.exe or chrome_proxy.exe
4) DRM-play support. Although the widevinecdm.dll file («Widevine Content Decryption Module provided by Google Inc.») is already located in the program folder, where it is usually located (with API-MS_WIN_XP libs kernel64.dll and xcryptprimitives.dll): "WidevineCdm_platform_specific\win_x86\"

Test to play DRM videos on one of the websites using the latest version of the cracked widevinecdm.dll library:

- https://drmnow.pro/check/
- https://bitmovin.com/demos/drm/



WebGPU assitant:

1. CRACKED Chrome Windows 7 browser ver. 114 or higher
2. Latest video-card driver with DirectX 11.0 compatible board (min: ATI Radeon HD 5870 / nVidia GTX 470)
3. Use hardware acceleration
4. Enabled this option in chrome://flags tab:
   - #enable-webgpu-developer-features
   - #webxr-webgpu-binding
   - #enable-unsafe-webgpu
5. Restart browser
6. Go to official next links
   - https://toji.github.io/webgpu-test/
   - https://webkit.org/demos/webgpu/

Latest stability improvements (LTS tea):

For crash prevent. Long Time Stable.

1. Upgraded API-MS_WINXP kernel64.dll
   - WinAPI PrefetchVirtualMemory[2]
   - WinAPI DiscardVirtualMemory[3]
   - WinAPI SetThreadInformation[4]
   - WinAPI CreateFile2[5]
   - WinAPI SetThreadSelectedCpuSets[6]
2. kernel64.dll: Preload DELAY_IMPORT for low token sub-processes (gpu, render, mojom);
3. Added new API-MS_WINXP lib XIAUTOMATIONCORE.dll for bridged to system32\UIAUTOMATIONCORE.dll
4. Any fixes at API-MS_WINXP user64.dll
5. Improve patches for absent OLE32.RoGetAgileReference
6. “GpuRasterTile” crash is fixed;
7. PE IMPORT API-MS-POWERSETTINGS… swap to default Windows 7 lib POWRPROF.DLL (system32)

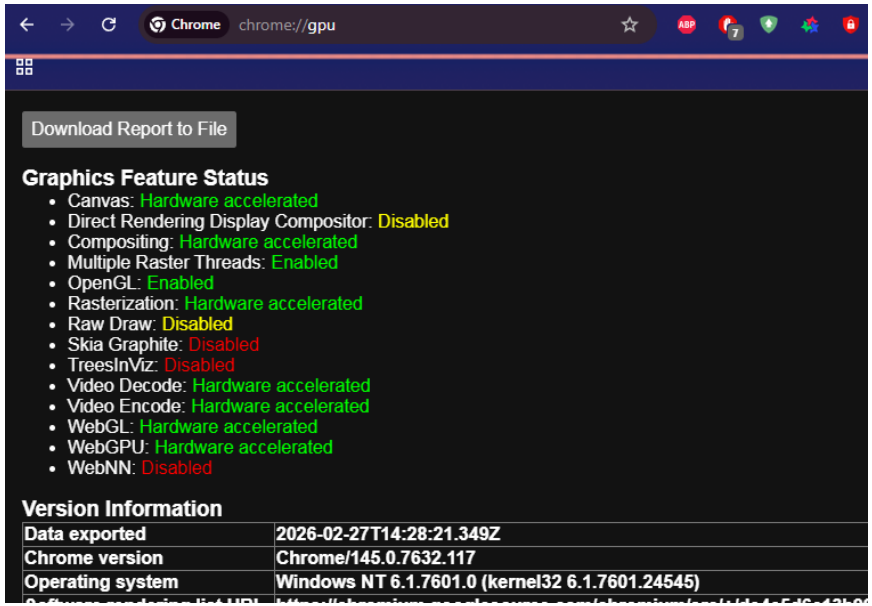
Known issues:

1. Windows 7 N editions. Install Windows 7 Media pack[7] update Windows6.1-KB968211-x64-RefreshPkg.msu[8] (x86) first for enable video decode options.

2. Check you latest video-driver for success hardware accelerated. Run chrome://gpu for get more technical information:



[7] https://learn.microsoft.com/en-us/troubleshoot/windows-client/shell-experience/windows-media-feature-pack-for-windows-7

[8] https://github.com/Blaukovitch/GOOGLE_CHROME_Windows_7/releases/download/discord_new/Windows6.1-KB968211-x64-RefreshPkg.msu

3. For activate WebNN request WindowsRT with Microsoft.Windows.AI.MachineLearning.ExecutionProviderCatalog

   But Windows 7 not contain WindowsRT.

4. Lot of memory eat – for more than three opened tabs. Because chrome.dll have above 220 Mbytes size (x86).
5. «Privacy COUNTERMEASURES» – any sites bad view.

Technical crashes report:

1. Send me screenshot of violate
2. Step-by-step instructions on how to reproduce the crash
3. Exact version of the operating system (e.g., Windows 7 Professional SP1, build 7601)
4. Can gather more logs (if need) – all logs gather in to LOGS[9] directory:

Name of batch file	Affected action
!!DEBUG_LOG.bat	**Run chrome.exe with full debug options. See debug.log file in to Chrome profiles**
!reg_DisableChromeVariations_Enterprise.reg	**Disable Chrome variations (with rules). See in chrome://version/**
!reg_DisableOSWarning_windows7.reg	**Disable Windows 7 end of support notify.**
!reg_ms-setting_windows7.reg	**chrome://settings/system see button with open proxy system settings.** **Set ms-settings: moniker for Windows7 with** rundll32 shell32.dll,Control_RunDLL inetcpl.cpl,,4 %l **command**

[9] For Program Files directory need administrative rights or modify batch files log dsd.
